

$$\begin{aligned}
 E1 \quad \Pr[(X, Y) \in A] &= \int_0^{1/2} \int_1^2 \frac{3}{5} x(y+x) dy dx \\
 &= \frac{3}{5} \int_0^{1/2} x \int_1^2 (y+x) dy dx = \frac{3}{5} \int_0^{1/2} x \left[\frac{1}{2} y^2 + xy \right]_1^2 dx \\
 &= \frac{3}{5} \int_0^{1/2} x \left[(2+2x) - \left(\frac{1}{2} + x \right) \right] dx = \frac{3}{5} \int_0^{1/2} \left(x^2 + \frac{3}{2} x \right) dx \\
 &= \frac{3}{5} \left[\frac{1}{3} x^3 + \frac{3}{4} x^2 \right]_0^{1/2} = \frac{3}{5} \left(\frac{1}{24} + \frac{3}{16} \right) = \frac{3}{5} \left(\frac{2+9}{48} \right) \\
 &= \frac{11}{80}
 \end{aligned}$$

$$\begin{aligned}
 E2 \quad \Pr[(X_1, X_2, X_3) \in A] &= \int_{-\infty}^1 \int_{-\infty}^1 \int_{-\infty}^{1/2} f(x_1, x_2, x_3) dx_1 dx_2 dx_3 = \int_0^1 \int_{1/2}^1 \int_0^{1/2} (x_1 + x_2) e^{-x_3} dx_1 dx_2 dx_3 \\
 &= \int_0^1 e^{-x_3} \int_{1/2}^1 \left[\frac{1}{2} x_1^2 + x_1 x_2 \right]_0^{1/2} dx_2 dx_3 = \int_0^1 e^{-x_3} \int_{1/2}^1 \left(\frac{1}{8} + \frac{1}{2} x_2 \right) dx_2 dx_3 \\
 &= \int_0^1 e^{-x_3} \left[\frac{1}{8} x_2 + \frac{1}{4} x_2^2 \right]_{1/2}^1 dx_3 = \int_0^1 e^{-x_3} \left[\left(\frac{1}{8} + \frac{1}{4} \right) - \left(\frac{1}{16} + \frac{1}{16} \right) \right] dx_3 \\
 &= \frac{1}{4} \int_0^1 e^{-x_3} dx_3 = -\frac{1}{4} [e^{-x_3}]_0^1 = -\frac{1}{4} (e^{-1} - 1) \\
 &= \frac{1}{4} \left(1 - \frac{1}{e} \right).
 \end{aligned}$$

I had not planned to do this one in class.

E3 For $x \geq 0$,

$$\begin{aligned}
 f_X(x) &= \int_{-\infty}^{\infty} f(x, y) dy = \int_0^{\infty} 4e^{-2x} \cdot e^{-2y} dy = 4e^{-2x} \left(\lim_{A \rightarrow \infty} \int_0^A e^{-2y} dy \right) \\
 &= 4e^{-2x} \lim_{A \rightarrow \infty} \left[-\frac{1}{2} e^{-2y} \right]_0^A = 2e^{-2x} \lim_{A \rightarrow \infty} (-e^{-2A} + 1) \\
 &= 2e^{-2x}.
 \end{aligned}$$

The integral producing $f_X(x)$ is zero if $x < 0$. Similarly, for $y \geq 0$,

$$f_Y(y) = \int_{-\infty}^{\infty} f(x, y) dx = \int_0^{\infty} 4e^{-2x} \cdot e^{-2y} dx = 4e^{-2y} \left(\lim_{A \rightarrow \infty} \int_0^A e^{-2x} dx \right)$$

$$= 4e^{-2y} \lim_{A \rightarrow \infty} \left[-\frac{1}{2} e^{-2x} \right]_0^A = 2e^{-2y} \lim_{A \rightarrow \infty} (-e^{-2A} + 1)$$

$$= 2e^{-2y}.$$

Note that, if either $x < 0$ or $y < 0$, $f_X(x) f_Y(y) = 0$. Otherwise,

$$f_X(x) f_Y(y) = (2e^{-2x})(2e^{-2y}) = 4e^{-2(x+y)}.$$

Thus, $f_{X,Y} = f_X(x) f_Y(y)$, and X, Y are independent.

E4 (a) For $y \in [0, 2]$,

$$f_Y(y) = \int_{-\infty}^{\infty} f_{X,Y}(x,y) dx = \int_0^1 \left(\frac{1}{4} x^2 + \frac{1}{4} y^2 + \frac{1}{6} xy \right) dx = \left. \frac{1}{12} x^3 + \frac{1}{4} xy^2 + \frac{1}{12} x^2 y \right|_0^1$$

$$= \frac{1}{12} + \frac{1}{4} y^2 + \frac{1}{12} y$$

So, for $0 \leq x \leq 1$, $0 \leq y \leq 2$,

$$f_{X|Y}(x|y) = \frac{f_{X,Y}(x,y)}{f_Y(y)} = \frac{\frac{1}{4} x^2 + \frac{1}{4} y^2 + \frac{1}{6} xy}{\frac{1}{12} + \frac{1}{4} y^2 + \frac{1}{12} y} = \frac{3x^2 + 2xy + 3y^2}{3y^2 + y + 1}$$

and

$$f_{X|Y}(x|y) = \begin{cases} \frac{3x^2 + 2xy + 3y^2}{3y^2 + y + 1}, & 0 \leq x \leq 1 \\ 0, & \text{otherwise} \end{cases}$$

$$(b) \Pr\left(X < \frac{1}{2} \mid Y=y\right) = \int_{-\infty}^{1/2} f_{X|Y}(x|y) dx = \int_0^{1/2} \frac{3x^2 + 2xy + 3y^2}{3y^2 + y + 1} dx$$

$$= \frac{1}{3y^2 + y + 1} \int_0^{1/2} (3x^2 + 2xy + 3y^2) dx = \frac{1}{3y^2 + y + 1} \left[x^3 + x^2 y + 3xy^2 \right]_0^{1/2}$$

$$= \frac{1}{3y^2 + y + 1} \left(\frac{1}{8} + \frac{1}{4} y + \frac{3}{2} y^2 \right)$$

$$= \frac{12y^2 + 2y + 1}{8(3y^2 + y + 1)}, \quad 0 \leq y \leq 2.$$

E5 For $0 < x < 1, 0 < y < 1,$

$$f(x, y) = \frac{\partial}{\partial y} \left(\frac{\partial}{\partial x} F(x, y) \right) = \frac{\partial}{\partial y} \left(xy + \frac{1}{2} y^3 \right) = x + \frac{3}{2} y^2.$$

So, the joint pdf is

$$f(x, y) = \begin{cases} x + \frac{3}{2} y^2, & 0 < x < 1, 0 < y < 1 \\ 0, & \text{otherwise} \end{cases}$$

$$\begin{aligned} \text{EG (i)} \quad E(X+Y) &= \iint (x+y) f_{X,Y}(x,y) dy dx = \iint x f_{X,Y}(x,y) dy dx + \iint y f_{X,Y}(x,y) dx dy \\ &= \int x \left(\int f_{X,Y}(x,y) dy \right) dx + \int y \left(\int f_{X,Y}(x,y) dx \right) dy = \int x f_X(x) dx + \int y f_Y(y) dy \\ &= E(X) + E(Y). \end{aligned}$$

$$\begin{aligned} \text{(ii)} \quad E(XY) &= \iint xy f_{X,Y}(x,y) dy dx = \iint xy f_X(x) f_Y(y) dy dx = \int x f_X(x) \left(\int y f_Y(y) dy \right) dx \\ &= \left(\int y f_Y(y) dy \right) \left(\int x f_X(x) dx \right) = E(Y) E(X). \end{aligned}$$

$$\begin{aligned} \text{(iii)} \quad \text{Var}(X+Y) &= E((X+Y)^2) - [E(X+Y)]^2 = E(X^2 + 2XY + Y^2) - [E(X) + E(Y)]^2 \\ &= E(X^2 + 2XY + Y^2) - [E(X)^2 + 2E(X)E(Y) + E(Y)^2] \\ &= E(X^2) + 2E(XY) + E(Y^2) - [E(X)]^2 - 2E(X)E(Y) - [E(Y)]^2 \\ &= E(X^2) - [E(X)]^2 + E(Y^2) - [E(Y)]^2 + 2[E(XY) - E(X)E(Y)] \\ &= \text{Var}(X) + \text{Var}(Y) + 2\text{Cov}(X, Y). \end{aligned}$$

By part (ii), $\text{Cov}(X, Y) = E(XY) - E(X)E(Y) = 0$ if X, Y are independent.

$$3.35 \quad f(x) = \frac{1}{\sigma\sqrt{2\pi}} e^{-(x-\mu)^2/(2\sigma^2)} \Rightarrow f'(x) = \frac{1}{\sigma^3\sqrt{2\pi}} e^{-(x-\mu)^2/(2\sigma^2)} (\mu - x)$$

$$\begin{aligned} \text{and} \quad f''(x) &= \frac{1}{\sigma^5\sqrt{2\pi}} e^{-(x-\mu)^2/(2\sigma^2)} (x^2 - 2\mu x + \mu^2 - \sigma^2) \\ &= \frac{1}{\sigma^5\sqrt{2\pi}} e^{-(x-\mu)^2/(2\sigma^2)} [(x-\mu)^2 - \sigma^2] \end{aligned}$$

$$\text{So, } 0 = f''(x) \Rightarrow (x-\mu)^2 = \sigma^2 \Rightarrow x = \mu \pm \sigma.$$

A close look at the expression $(x-\mu)^2 - \sigma^2$ shows that it, and hence

the density f , changes sign at the points $x = \mu \pm \sigma$, showing they are, indeed, points of inflection.

3.40 (a) $E(X) = 3 \cdot \Gamma(1 + \frac{1}{2}) \doteq 2.6587$

$$\text{Var}(X) = 9 \left[\Gamma(2) + \Gamma(1 + \frac{1}{2})^2 \right] \doteq 16.0686$$

(b) $g_{\text{weibull}}(0.5, 2, 3) \doteq 2.498$

(c) $\Pr[X \leq E(X)] = p_{\text{weibull}}(2.6587, 2, 3) \doteq 0.5441$

(d) $\Pr(1.5 \leq X \leq 6) = p_{\text{weibull}}(6, 2, 3) - p_{\text{weibull}}(1.5, 2, 3) \doteq 0.7605$

(e) $\Pr[E(X) - \sqrt{\text{Var}(X)} \leq X \leq E(X) + \sqrt{\text{Var}(X)}] \doteq 0.9928.$

3.46 (a) A normal model appears to be reasonable, though there is a slight curve to the normal quantile plot.

(b) The individual plots seem straighter still. There may be some diversion from normality at the extremes.
